

iSenseVR

Full Immersion
Virtual Reality
Extinguisher Training

Are you confident that in the event of a fire, your facility would know the exact location of the fire extinguishers and how to effectively use them?

iSenseVR enables hands-on use training for scenarios that are inherently unsafe and not possible due to environment or regulatory constraints.

First 5 Minutes iSenseVR HOT Fire Training has been designed and developed by our own industry experts in conjunction with one of Australia's emerging VR leaders. Learn how to use an extinguisher and put out a fire in an alternate environment without the hazards that come from a live fire.

This training will equip your people with the practical experience and knowledge required to use fire extinguishers and fire safety equipment on small workplace fires before they get out of control.

Training by the experts

Our training considers the chemistry and physics of fires, extinguisher mediums and expected responsive behaviour types.

Our specialists have been training people in the proper and effective use of fire extinguishers for more over 30 years.

They regularly deliver onsite fire extinguisher training across Australia.

The experience is a 'full immersion' one where you enter an alternate reality, you will be asked to identify the existence of a fire, decide on the type of extinguisher to use and then use it to extinguish the fire in an appropriate manner.

Training outline

Delivered onsite for your convenience, the training will cover:

- ✓ The chemistry and nature of fire
- ✓ Classification of materials
- ✓ Different types of fire
- ✓ Type of portable fire-fighting equipment found in the workplace
- ✓ The identification of different extinguishers and their safe and effective method of operation
- ✓ Practical (hands-on) fire extinguisher operation - where all participants trial the VR exercise to extinguish their own fire.

Course participants should not exceed 15 persons in the interests of ensuring good learning outcomes.

Who should attend

Members of the Emergency Control Organisation (ECO)/Wardens Team should take part in this training as a skills session. We also recommend that Wardens undertake refresher training at least once every 12 months. You may also choose to have some or all your employees trained to maximise preparedness.

Duration

The course runs for approximately 90 minutes, including theoretical (classroom) and practical (hands-on) training. Successful completion of this course will help participants to meet the relevant OH&S obligations for their workplace. A register of participants will be recorded during the training session and a copy will be issued to you upon completion of the training course.

With a combination of both theoretical training and practical experience in the use of fire-fighting equipment, participants will come away with the confidence to deal with any small workplace fire quickly and safely.
